GITPAGEDOCS / QUICK REFERENCE

# One container. Several files.

Paginate Markdown, HTML, video, audio or PDF without leaving the current documentation page. Each container maintains its own selected file.

## Configure once, override per route

| Setting | Behavior |
| --- | --- |
| site.containerPagination | Shared defaults in gitpagedocs/config.json. |
| route.pagination.items | Ordered route IDs from the same content type. |
| item.title / description | Localized metadata for the selected file. |
| alignment / placement | left, center or right; top, bottom or both. |
| display / showCount | Icon or text controls; optional page counter. |
| controls / icons / labels | Customize each of the four navigation actions. |

## Example: a PDF route with two files

```
"pagination": {
  "alignment": "right",
  "placement": "bottom",
  "items": [{ "routeId": 23 }, { "routeId": 55 }]
}
```

First, previous, next and last controls appear at the bottom right by default, with the current page and total. The same Markdown pagination is available in focus mode. Ctrl+K can find and open each configured file.

## Try the example

Open Guides > Read and explore > Paginated containers example. Change the PDF page to compare this reference with the full project guide. The audio examples are short generated tones; the video examples use the public MDN flower clip in MP4 and WebM formats.
